TITLE: A radial second-order density matrix and its use for deriving the exchange potential

CITED SOURCE: Tr. Gruz. politekhn. in-t, No. 8(93), 1963, 217-223

TOPIC TAGS: density matrix, second order density matrix, radial density matrix, exchange potential, simplified exchange operator, radial equation, self consistent field

TRANSLATION: Using a second-order radial density matrix, gives an approximate expression for the exchange potential. Establishes the connection between the Slater and Fock simplified exchange operators. By the method of successive approximations there is solved the single-electron radial equation of a simplified self-consistent field. Specific calculation done for the

Card 1/2

ACCESSION NR: AR4043995

ground state of the Ge atom. Initial functions were found using Hartree functions. As a result of solving the equation for the Ge atom it was concluded that the simplified exchange operator qualitatively exerts the same influence on the behavior of wave functions as does the precise Fock exchange operator. Calculation results cannot be obtained with the same accuracy as with the Fock method. However, the simplified method of the self-consistent field increases the accuracy of the Hartree method, and is a considerable improvement over the latter.

AUTHOR: Gurchumeliya, A. D.

TITLE: On calculating the atomic scattering factor of x-rays

SOURCE: Kristallografiya, v. 10, no. 2, 1965, 245-246

TOPIC TAGS: atomic scattering factor, x-ray scattering, Thomas-Fermi method, Hartree-Fock method, self consistent field

ABSTRACT: In determining the intensity of x-rays scattered at some angle θ , it is necessary to know as accurately as possible the atomic scattering factor $f_p(k)$ which is given by the formula

$$f_p(k) = \int P(r) \frac{\sin kr}{kr} dr, \quad (1)$$

in the case of spherical electron distribution, where $k = 4\pi \sin \theta / \lambda$, λ is the x-ray wavelength and $P(r)$ is the radial density of the electron charge which may be determined only approximately. The Thomas-Fermi method is considered a satisfactory approximation for heavy atoms. More accurate results may be obtained in the general case by using the Hartree-Fock self-consistent field method for calculating the

Card 1/3

L 42399-65

ACCESSION NR: AP5008470

O

electron density. This method gives radial wave functions which may be used to calculate $P(r)$. Tables of the $f_p(k)$ for various atoms have been calculated. In this article the atomic scattering factor is calculated using the analytic expression for the Hartree-Fock potential

$$V_{H-F}(r) = \frac{Z}{r} \sum_n C_n \exp(-b_n r) \quad (2)$$

where $x = 1.13\sqrt{Z} \cdot r$. Poisson's equation gives the electron density as

$$\rho(r) = \frac{1}{r} \frac{d^2 Y(r)}{dr^2} \quad (3)$$

where $Y(r) = Z \cdot \sum_n C_n \exp(-a_n \cdot r)$, $a_n = 1.13\sqrt{Z} \cdot b_n$. The atomic scattering factor calculated from (3) ($D(r) = \rho(r) \cdot r^2$) is given by the simple formula

$$F^2 = Z \cdot \Gamma(n+2) \cdot \sum_n \frac{C_n}{a_n^n} \quad (4)$$

A comparison of the results from this formula with the data given in the 3d volume of the *International Tables for X-Ray Crystallography* shows a divergence of no more

TITLE: A method for making transparent plastics 6

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 11, 1965, 80

TOPIC TAGS: transparent plastic, fiberglass

ABSTRACT: This Author's Certificate introduces a method for making transparent plastic based on Author's Certificate No. 128992. Plastics with improved properties are produced by treating a fiberglass filler with mixed epoxymetallocsiloxanes which form a bond with the glass and contain furfuroxyl groups. A phosphate binder is then applied to the treated fiberglass.

Factors Influencing the Performance of Viscosimeters of the Rotating Type (Faktory, vliyayushchiye na rabotu viskozimetra rotatsionnogo tipa)

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Neft' i gaz,
1959, Nr 2, pp 41 - 46 (USSR)

ABSTRACT:

The purpose of the paper under review was to analyze the performance of rotating viscosimeters basing upon the principle of the movement of a liquid in the interspace between two concentric cylinders. The equipment, the measuring methods and the processing of the data were discussed before (Ref 5). In the analysis it was determined that the changes of the values η (viscosity) and τ (dynamic tension) in the rotating viscosimeter with the increase of the speed gradient beyond a certain maximum depend on the effect of the centrifugal forces. The centrifugal forces affect the depositing of the clay mass in heterogeneous cylindrical layers that differ by their rheological qualities. Nothing of the kind occurs in homogeneous liquids. High-speed rotating viscosimeters cannot record any actual rheological current curves of heterogeneous

Card 1/2

Factors Influencing the Performance of Viscosimeters of SCV/102-59-2-11/32
the Rotating Type

liquids because of the effects of centrifugal forces. In viscosimeters of the capillary type the effects of centrifugal forces are absent. For this reason, they can accurately record the rheological characteristics of the clay mass. The centrifugal forces, the dropping of the level in the space of the viscosimeter as well as the gliding along the walls contribute to the inaccuracy of the recordings of rotating viscosimeters. There are 4 figures, 1 table and 15 Soviet references.

TITLE:

The Influence of Dynamic Effects on the Rheological Properties
of Sound Suspensions (Vliyanije dinamicheskikh vozdeystviy na
reologicheskiye svoystva suspenziy gliny)

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Neft' i gaz, 1959,
Nr 3, pp 45-49 (USSR)

ABSTRACT:

Sound suspensions are completely characterized by the values η - structural viscosity and τ_0 - shearing stress. The determination of these quantities differs according to the measuring apparatus used. Various hypotheses were set up by other authors with respect to this phenomenon of thixotropy. The present paper explains the true reasons. Measurements are carried out by means of a vibration viscosimeter. It was possible to vary the amplitude of the oscillations between 0-7 mm and the frequency from 0-3000/min. Curves were plotted describing the dependence of viscosity upon frequency and amplitude. With increasing frequency and amplitude, lower values are obtained for η and τ_0 . This is the explanation for this phenomenon: the suspension of sound in water shows a marked polydisperse

Card 1/3

The Influence of Dynamic Effects on the
Rheological Properties of Sound Suspensions

SOV/152-59-3-9/25

system. In this connection the dispersity of particles fluctuates between the purely colloidal particle and the bigger microparticle. When vibration sets in, a reduction of the consistency of the spatial coagulation structure first occurs. Then, the remaining aggregates are destroyed. The sound particles which are not isodiametrical form layers while flowing and their long axes take the direction of flow. Shear takes place in the free dispersion medium, occupying the space between the sound particles. Finally, vibration acts upon the hydrate shells. Part of the bound water is released. The breaking of the water-shells reduces solvation and the surface of the micells. Part of the ions is separated from the shell, is distributed in the dispersion medium, and leads to a changed electric interaction between the micells. This stepwise process entails a reduction of consistency. Every suspension requires a certain time after which stable flowing conditions set in. There are 5 figures, 1 table, and 16 references, 15 of which are Soviet.

TITLE: Magnetic relaxation of nuclei in semiconductors and semimetals in a quantizing magnetic field

SOURCE: Ref. zh. Fizika, Abs. 9E205

REF SOURCE: Sb. Elektron. i ion. protsessy v tverd. telakh. No. 2. Tbilisi, Metsniyereba, 1965, 72-81

TOPIC TAGS: magnetic field, quantum electronics, nuclear magnetic relaxation

ABSTRACT: The relaxation time of nuclei in semiconductors or semimetals in a magnetic field of such intensity that the quantization of electron space motion becomes essential, is calculated. Cases of nondegenerate and strongly degenerate carrier gas are studied. Relaxation is presumed to occur at the expense of contact interaction of nuclear spins with conduction electrons. It is supposed that the energy zones possess the isotropic quadratic law of dispersion. The presence of peaks in transition probability is established. These peaks are more strongly

GREENLAW, B S

✓ Adsorption potentials for concentrated inorganic acids.
B.S. ~~UNIVERSITY~~ (U.S. Leningrad State Univ., Moscow).
Zhur. Tekh. Kemi. 30, 1806 (1956). The adsorption
potentials were measured for solns. of HCl, HBr, and
H₂SO₄ both on their free surface as well as at an acid-Hg
boundary. The acid concns. were varied from 0 to 15.81
M. The measurements showed that the potentials on the
free surface are of the same order of magnitude as those at
the acid-Hg interface for concd. solns. The adsorption

potential depends on the quantity of ions in the surface
layer. J. Berlin. Land.

Prof. S.Z. KOLSTØY, Corresponding Member of the Academy of Sciences, USSR
and O.W. ERLIN, Candidate of Chemistry; Ed. of Publishing House: A.I.B.

EDITORIAL TECH. ED.: VANCE M. JONES

CONTENTS: The articles in this collection were read at the conference on the Physics and Physical Chemistry of Crystals organized by the Central Institute with the Academy of Sciences (Section of Chemical Sciences, Academy of Sciences of the U.S.S.R.) and by the Academy Council on the problem of "the scientific bases for the selection of catalysts." The conference was held at the Institute of Technology in Moscow, March 22-25, 1958. Some articles of physical chemistry of the II (unpublished) in Moscow, March 22-25, 1958, or of the same volume or material presented at the conference, only parts not published elsewhere were included in this collection.

TITLE: Some properties of silicone-modified nitrocellulose surface coatings

PERIODICAL: Chemie a chemická technologie, 1961, Vol.18, No.1, p.33, abstract Ch 61-451 (Lakokras. Materialy, 1960, No.1, pp.13-17)

TEXT: The reaction of nitrocellulose with organic silicone derivatives leads partly to a replacement of OH- by OSi-groups, and partly to transesterification of the nitric esters, with the production of high-molecular nitrocellulose derivatives and containing Si in linear or cross-linked structures. The physical and mechanical properties of coatings prepared from these polymers are listed. The modification, by means of organic silicones, improves the heat and water resistance of the coatings and increases their strength, adhesion and impact strength. 1 diagram, 1 table, 19 literature references.

TOPIC TAGS: luminescence, crystal phosphor, zinc sulfide, current carrier, luminophor

ABSTRACT: Introduction of new experimental methods has increased rather than reduced the disagreement among different investigators regarding the structure of zinc sulfide luminophors. On the basis of previous investigations of glow curves and the polarity of the photocurrent carriers the authors showed that for the most part the discrepancies are due to inadequate control of the synthesis conditions, i.e., that the phosphors studied by different groups differed as regards structure owing to unintentional variations of the preparation conditions. Experiments show, for example, that truly self-activated ZnS exhibits only one glow curve peak, but that if the compound
